4”-20” VERTICAL UPFLOW METERS MODELS VF27, VF28, VF29, VF30

OPERATION AND MAINTENANCE MANUAL

PARTS LIST

FEATURING:
* STANDARD TOTALIZER ASSEMBLY
* MODEL CN06-2 INDICATOR-TOTALIZER
* CERAMIC BEARING CARTRIDGE PROPELLER
* ONE PIECE SEPARATOR/SPINDLE AND THREADED REVERSE THRUST BEARING CARTRIDGE
WARRANTY

This Warranty shall apply to and be limited to the original purchaser consumer of any McCrometer product. Meters or instruments defective because of faulty material or workmanship will be repaired or replaced, at the option of McCrometer, free of charge, FOB the factory in Hemet, California, within a period of one (1) year from the date of delivery.

Repairs or modifications by others than McCrometer or their authorized representatives shall render this Warranty null and void in the event that factory examination reveals that such repair or modification was detrimental to the meter or instrument. Any deviations from the factory calibration require notification in writing to McCrometer of such recalibrations or this Warranty shall be voided.

In case of a claim under this Warranty, the claimant is instructed to contact McCrometer, 3255 W. Stetson Ave., Hemet, California 92545, and to provide an identification or description of the meter or instrument, the date of delivery, and the nature of the problem.

The Warranty provided above is the only Warranty made by McCrometer with respect to its products or any parts thereof and is made expressly in lieu of any other warranties, by course of dealing, usages of trade or otherwise, expressed or implied, including but not limited to any implied warranties of fitness for any particular purpose or of merchantability under the uniform commercial code. It is agreed this Warranty is in lieu of and buyer hereby waives all other warranties, guarantees or liabilities arising by law or otherwise. Seller shall not incur any other obligations or liabilities or be liable to buyer, or any customer of buyer for any anticipated or lost profits, incidental or consequential damages, or any other losses or expenses incurred by reason of the purchase, installation, repair, use or misuse by buyer or third parties of its products (including any parts repaired or replaced); and seller does not authorize any person to assume for seller any other liability in connection with the products or parts thereof. This Warranty cannot be extended, altered or varied except by a written instrument signed by seller and buyer.

This Warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

McCrometer reserves the right to make improvements and repairs on product components which are beyond the Warranty period at the manufacturer’s option and expense, without obligation to renew the expired Warranty on the components or on the entire unit. Due to the rapid advancement of meter design technology, McCrometer reserves the right to make improvements in design and material without prior notice to the trade.

All sales and all agreements in relation to sales shall be deemed made at the manufacturer’s place of business in Hemet, California and any dispute arising from any sale or agreement shall be interpreted under the laws of the State of California.

* For Indicator-Totalizer Models Only

VERTICAL UPFLOW METER
INSTALLATION

I. UNCRATING. When uncrating the meter, any damage due to rough or improper handling should be reported to the transportation firm and McCrometer. If for any reason it is determined that the unit or parts of the unit should be returned to the factory, please contact McCrometer for clearance prior to shipment. Each unit must be properly crated to prevent any further damage. The factory assumes no responsibility for equipment damage in return shipment due to improper packaging. The shipping crate contains the following items:
   Vertical Upflow Meter with Standard Totalizer (VF27 or VF29).................................1
   Vertical Upflow Meter with CN06-2 (VF28 or VF30)..................................................1
   Mounting Equipment as required ..............................................................................1
   Operation and Maintenance Manual .................................................................1
   Tool T-2402-1 ........................................................................................................1

II. INSTALLATION of McCrometer Vertical Upflow Meters varies depending upon the type and model of meter selected for each application. The meter must have a full flow of liquid for proper accuracy. The meter installations fall into two basic categories:

1. MODEL VF27 and VF28 are designed to allow installation to an appropriate cast iron or fabricated steel tee. These tees usually replace an elbow in existing systems. Fully opened gate valves, fittings, or other obstructions that tend to set up flow disturbances should be a minimum of five pipe diameters upstream from meter location.

2. MODEL VF29 and VF30 TEE can be installed similar to placing a flanged elbow or tee in the line. Installation can be made to any vertical discharge concrete turnouts with proper anchor bolts. The meter must be installed upright for a full flow of liquid through the pipe to assure proper accuracy. Fully opened gate valves, fittings, or other obstructions that tend to set up flow disturbances should be a minimum of five pipe diameters upstream from the meter location.

VERTICAL UPFLOW METERS
OPERATION AND MAINTENANCE MANUAL

III. MCCROMETER products have been carefully designed to be as maintenance free as possible. Periodic preventive maintenance, however, is highly recommended and should be practiced according to schedule to assure continuous accuracy and trouble-free performance of your propeller meters. The maintenance and inspection procedure can also be used as a guide to locating a problem in the unit that may be the cause of abnormal meter operation.

Routine preventative maintenance should be performed on
all meters, which includes cleaning and an inspection of the propeller and its bearing. The intervals between inspections depend on the water quality and the usage of the meter. The initial inspection should be performed after one to two years of service, to determine the period between future inspections. After five to ten years, the completer meter should be inspected to ensure years of dependable service.

**IV. METER HEAD ASSEMBLY** should be removed from the tee or meter tee tube by removing the meter head bolts (#45) and lifting the entire head assembly upward, taking care not to damage the propeller assembly as it is pulled clear of the tee flanged end. Inspect the meter head o-ring (#44) or flat gasket for any signs of damage and replace if necessary. Replace the meter head assembly with a dummy cover plate if the service line is to remain in operation.

**V. WORKING AREA** chosen for disassembly and reassembly of the internal meter components should be clean to reduce the chance of dust or dirt particles being introduced into the meter mechanism.

**VI. TOTALIZER ASSEMBLY (#4)** service procedure should include cleaning and inspection of the unit noting any excessive wear on the change gears (#7 & #8) that may lead to operational problems in the unit.

1. **BONNET MOUNTING SCREWS (#3)** should be removed and the entire bonnet (#1) lifted off the meter.

2. **TOTALIZER** is contained within the totalizer bonnet (#1) and held in place by a base cup (#5). It should not be necessary to remove the totalizer (#4) during inspection; however, removal of the base cup (#5) is necessary for inspection of the totalizer change gears (#7 & #8). Removal of the base cup (#5) can be accomplished by inserting a small screwdriver into the two cutouts and prying upward under the edge.

3. **TOTALIZER CHANGE GEARS (#7 & #8)** should be inspected for any sign of wear. Both the A-(drive) gear and B-(driven) gear are attached to the lower portion of the totalizer assembly (#4). Spin the floating totalizer driven magnet in the center of the totalizer bottom (#4) to make certain it spins freely without bind or drag. The bottom of the totalizer has the letter “A” molded next to the A-drive gear shaft, and the letter “B” next to the B-driven gear shaft.

4. **TOTALIZER DRIVE MAGNET ASSEMBLY (#12)** located in the meter head (#13) at the top of the vertical shaft assembly (#23) should be checked and adjusted, if necessary, to position it 1/16” below the top surface of the meter head (#13). Adjustments can be made by loosening the socket head set screw in the side of the totalizer drive magnet assembly (#12) and sliding it up or down the vertical shaft (#23) as desired. Always be sure the set screw is tightened into the flat area on the vertical shaft (#23).

**VII. INDICATOR-TOTALIZER** service procedure includes removal, cleaning and inspection of the unit noting any excessive wear on the gears and other wear points that may lead to operational problems in the unit.

*1. BONNET MOUNTING SCREWS (#3), located beneath the indicator-totalizer bonnet lid, should be removed and the entire bonnet (#1) lifted off the meter. Replace the o-ring seals around each of the four screws (#3) and at the bottom of the bonnet (#4) and cover each of the new o-rings with a thin coat of silicone grease.

*2. INDICATOR MOUNTING SCREWS (#6) and shake-proof washers (#7) holding the indicator-totalizer unit (#5) to the meter head (#13) should be removed and the unit lifted off, exposing the A-drive gear (#11) attached to the top of the vertical shaft (#23).

*3. METER CHANGE GEARS should be inspected for any sign of wear. The A-(drive) gear (#11) is attached to the top of the vertical shaft (#23), and the B-(driven) gear (#12) is attached to the bottom of the indicator (#5). The position of the A-drive gear should be checked and adjusted, if necessary, to position the top face of the gear 1/8” below the top surface of the meter head (#13). The position of the B-driven gear top face should be 1/8” below the bottom of the indicator-totalizer.

*4. INDICATOR-TOTALIZER unit (#5) should be cleaned thoroughly using a mild soap and a soft brush. Under no circumstances should the entire unit be immersed in the soap or should any metal object be used when cleaning and inspecting the internal parts of the indicator-totalizer unit.

*5. GEARS within the indicator-totalizer unit (#5) should be inspected carefully. If any excessive wear is visible on the gear teeth and other wear points, the unit must be returned to McCrometer for repair.

**VIII. VERTICAL SHAFT ASSEMBLY (#23)** is pulled directly out the top of the meter after removing two screws (#29) inside the meter head (#13) holding the vertical shaft support plate (#28) and bearing assembly (#26) to the meter head (#13). Spin both the upper bearing assembly (#26) and the lower bearing assembly (#24) gently, checking for any sign of wear. Inspect the vertical shaft assembly (#23) to be sure it is not bent or damaged.

**IX. PROPELLER ASSEMBLY (#31)** inspection should include cleaning the ceramic sleeve bearing (#33), separator assembly (#35), and the propeller assembly (#31).

1. **PROPELLER REMOVAL** can be accomplished by first removing the thrust bearing cartridge assembly (#42). Loosen the set screw (#41) in the side of the nose of the propeller. Remove the thrust bearing cartridge (#42) by turning it counterclockwise while holding the propeller in place.

2. **REVERSE THRUST BEARING CARTRIDGE (#38)** must now be removed. Turn the propeller (#32) so that the Allen wrench clearance hole is lined up with the set screw in the side of

*For Indicator-Totalizer Models*
the reverse thrust bearing cartridge (#38). The location of
the set screw is marked by a small hole drilled in the face
of the reverse thrust bearing cartridge. With a 5/64” Allen
derived in the reverse thrust bearing cartridge (#38) two to three turns, which will allow
the cartridge to be unscrewed without damaging the spindle
thread. Note: If the bearing area appears to be clogged
with dirt or sediment, making it difficult to locate the set
screw (#39) or to allow the Allen wrench to fit into the set
screw socket, then the bearing area should be flushed out
with water. Insert Tool T-2402X-1 into the propeller through
the threaded nose. The tabs in the tool should engage in
the screwdriver slot in the end of the reverse thrust bear-
cartridge (#38). Remove the propeller assembly (#31)
and reverse thrust bearing cartridge (#38) by turning Tool
T-2402X-1 counterclockwise, unscrewing the reverse thrust
bearing cartridge (#38) from the spindle (#19). The propeller
assembly with reverse flow cartridge will now slide off the
spindle. WARNING: If the reverse thrust cartridge does not
unscrew easily, it may be because the set screw was not
unscrewed enough. If unscrewing the reverse flow cartridge
is continued with the set screw binding on spindle thread,
damage to thread could occur.

3. WATER LUBRICATION of the ceramic sleeve bearing (#33) is
achieved by means of two openings in the end of the thrust
bearing cartridge (#42) which allow air to be purged from
the bearing area. These should be cleared of any foreign
material by running a small wire through the holes on either
side of the screwdriver slot.

4. CERAMIC BEARING CARTRIDGE (#33) and drive magnet
(#35) should be cleaned of any foreign material and inspected
for damage. Using a bottle brush, thoroughly clean the ce-
eramic bearing surface (#33) and the magnet inside diameter
(#35). After cleaning the propeller, flush the inside out with
water. The outside surfaces of the propeller should also be
cleaned to assure a smooth, unrestricted flow across the
surface of the propeller. Do not use an oil based solvent in
cleaning, as damage to the assembly could occur.

5. SPINDLE CERAMIC SLEEVE (#20) and the O.D. or surface
of the separator (#18) should be cleaned and inspected for
any substantial amount of wear. The thrust bearing (#4.3)
should be checked for any damage. If it is determined that
the spindle ceramic sleeve (#20) or separator (#19) are worn
sufficiently, the separator/support spindle assembly (#18)
should be replaced.

6. SEPARATOR/SUPPORT SPINDLE ASSEMBLY (#18) can be
removed for replacement by removing the four mounting
screws (#21) which thread into the gearbox. Separator o-ring
(#22) should be replaced and the new o-ring (#22) covered
with a thin coat of silicone grease. The separator/support
spindle assembly (#18) can then be replaced in the front of
the drop pipe (#14) with a firm push, gently rotating the
assembly at the same time. Replace and tighten the four
mounting screws (#21).

7. PROPELLER INSTALLATION is accomplished by following
these steps: a) The reverse thrust cartridge set screw
(#39) should be protruding out of the reverse thrust bearing
 cartridge so it will not bind up on the spindle thread. Note:
Look through the end of the propeller and hole in the reverse
thrust cartridge to be sure the set screw is not showing. b) Slide
the propeller assembly onto the support spindle (#18)
onto the spindle. If you feel any resistance when threading
the reverse thrust cartridge on, stop at once and check to be sure
the set screw is not binding on the thread. Be careful not to
cross-thread the reverse thrust bearing cartridge. Thread the reverse thrust bearing cartridge (#32) onto the spindle (#18)
until the trailing edge of the propeller contacts the drop pipe
(#14). Set the proper end play by inserting a 5/64” Allen
wrench into the reverse thrust bearing set screw (through the
side of the propeller) and loosen the reverse thrust bearing
cartridge (#38) 1/2 turn counterclockwise. Tighten the set
screw in reverse thrust bearing cartridge. There should be
approximately .020” clearance between the gearbox (#14)
and trailing edge of the propeller when the propeller in pulled
forward (away from the drop pipe). The propeller must not
contact the drop pipe.

8. THRUST BEARING CARTRIDGE ASSEMBLY (#42) should
be inspected for damage and replaced in the nose of the
propeller. The thrust bearing cartridge (#42) is used to
adjust the amount of longitudinal end play of the propeller
assembly on its spindle (#19), which should be about 1/64”.
End play can be adjusted by turning the thrust bearing car-
tidge assembly (#42) clockwise until it tightens against the
end of the support spindle (#19), then turning thrust bearing
cartridge (#42) counterclockwise 1/8 of a turn. Tighten set
screw (#41). Check the longitudinal end play of the propeller
to ensure it’s not excessive and does not allow the propeller
(#31) to contact the drop pipe (#14). Check the clearance
between the propeller (#31) and drop pipe (#14). The clear-
ance should be approximately .010” between the drop pipe
(#14) and trailing edge of the propeller when the propeller in
pushed back (toward the drop pipe). The propeller assembly
(#31) must spin freely.

9. PROPELLER BEARING (#33) can be checked for excessive
radial play by rocking the propeller (#32) gently from side to
side on the spindle (#19). Some play is required for proper
operation of the water lubricated ceramic sleeve bearing.

X. INSPECTION of all internal meter parts that may be replaced
in the field has been accomplished at this point. Should any
of the meter parts, upon inspection, appear to be damaged
or excessively worn, they must be replaced to assure proper
meter operation and prevent further damage.

XI. REASSEMBLY is necessary at this point. Before reassembling
any parts, make certain that each is cleaned of any dust or
dirt and properly lubricated. Costs for replacement parts not
covered by warranty are available from current parts and price
If it is determined that the meter should be returned for repair, please notify McCrometer prior to shipment. Each meter must be properly packaged to prevent damage to the meter in shipment.

1. **VERTICAL SHAFT ASSEMBLY (#23)** should be inserted gently into the separator (#18) through the opening in the top of the meter head (#13). Take care not to chip the ceramic magnet when replacing the shaft. Replace and secure two screws and shakeproof washers (#29 & #30) that hold the vertical shaft upper bearing support plate (#28) in place. Turn the top of the vertical shaft (#23) to check for any bind or drag. Should any bind or drag be apparent, it can usually be corrected by adjusting the vertical shaft collar and bearing assembly (#26). Loosen the set screw (#41) in the side of the assembly (#26) and slide the shaft (#23) downward until it rests against the bottom of the separator (#18), then lift up about 1/64". Tighten set screw (#41).

2. **TOTALIZER DRIVE MAGNET ASSEMBLY (#12)** should be checked again to make certain it is properly set to drive the totalizer (#4). (See step VI, 4.)

3. **TOTALIZER BASE CUP (#5)** can be placed back in the totalizer bonnet (#1) on the totalizer assembly (#4) after the desiccant capsule and the base cup o-ring (#6) are replaced. Be sure o-ring (#6) is on base cup (#5) properly.

4. **TOTALIZER Bonnet Assembly (#1)** should be cleaned and replaced on the meter head (#13). Bonnet o-ring (#2) should be replaced and the new o-ring (#2) covered with a thin coat of silicone grease. Secure four screws (#3).

5. **CHANGE GEARS (#11 & #12)** should be checked again to make certain they are in proper alignment (see step VII-3.)

6. **INDICATOR-TOTALIZER** mechanism (#5) should be placed on the meter head (#13) with the mounting screws and shake-proof washers (#6 & #7). The B-driven gear (#12) should be set in the cutout in the meter head (#13). Do not tighten mounting screws (#6) until the gear mesh has been properly adjusted. To adjust gear mesh slide the indicator-totalizer mechanism (#5) towards the A-drive gear (#11) until the unit stops because of full gear mesh. Now back off the indicator-totalizer mechanism 1/64" and tighten mounting screws (#6).

7. **INDICATOR BONNET Assembly (#1)** should be cleaned and replaced over the indicator-totalizer unit (#5) after the desiccant bag is replaced. Secure four screws (#2) beneath the bonnet lid. Do not overtighten the mounting screws (#2) as this will result in damage to the screw o-rings (#3).

8. **PROPeller Assembly (#31)** should be dipped in water to lubricate the propeller ceramic sleeve bearing (#33). Spin the propeller (#32) gently to make certain the meter operates smoothly and no bind or drag is apparent.

*For Indicator-Totalizer Models Only*

9. **METER HEAD O-RING OR FLAT GASKET (#44)** should be inspected for any sign of damage. O-ring should be covered with a thin coat of silicone grease. The meter can now be installed in the service line. When replacing the meter on the line, make certain that the top of the meter tube or tee is smooth and free of any foreign material. Make certain that no foreign materials are attached to the inside of the service line pipe, as any flow disturbance or obstruction may affect the accuracy of the meter.

**METER NOT REGISTERING**

- **Correct Problem**
  - **Yes**
  - **No**

- **Correct Problem**
  - **Yes**
  - **No**

**Apply a light finger pressure to vertical shaft. Is vertical shaft turning now?**

- **Yes**
  - **No**

  **Problem is in totalizer, ind./tot. or transmitter or their connection to vertical shaft. Repair per MFG. instructions or return to factory for repair.**

**Remove meter from line. Is debris blocking propeller?**

- **Yes**
  - **No**

  **Spin propeller by hand. Does vertical shaft turn?**

  - **Yes**
    - **No**

  **Problem is in lower portion of meter. Repair per MFG. instructions or return to factory for repair.**

**Does meter have the required upstream & downstream straight runs of pipe?**

- **Yes**
  - **No**

  **If meter has ind./tot., time totalizer test hand to confirm flow rate reading on indicator.**

  **If all of the above checks out, return meter to factory to be accuracy tested.**

**Is water flowing?**

- **Yes**
  - **No**

**Is flow rate above minimum required for meter?**

- **Yes**
  - **No**

**Is there a full pipe of water?**

- **Yes**
  - **No**

**Remove totalizer, ind./tot. or transmitter. Is vertical shaft turning?**

- **Yes**
  - **No**

WARNING:

BEFORE REMOVING THE METER HEAD FROM THE PIPELINE THE WATER MUST BE TURNED OFF AND PRESSURE MUST BE RELIEVED FROM THE LINE. SERIOUS INJURY CAN RESULT FROM REMOVING A METER HEAD UNDER PRESSURE.
